### **ARTICLES OF INTEREST – August, 2023**

Survival and long-term outcomes of children who survived after end-of-life decisions in a neonatal intensive care unit

Béatrice Boutillier, Valérie Biran, Annie Janvier, et al. *J Pediatr*.

<https://pubmed.ncbi.nlm.nih.gov/37076039/>

To investigate long-term outcomes of infants who survive despite life-and-death discussions with families and a decision to withdraw or withhold life-sustaining interventions (WWLST) in one neonatal intensive care unit. When a WWLST decision was made in our cohort, 21% of the infants survived to discharge. By 2 years of age, the majority of these infants had died or had major functional limitations. This highlights the uncertainty of WWLST decisions during neonatal intensive care and the importance of ensuring that parents are informed of all possibilities. Additional studies including longer-term follow-up and ascertaining the family's views will be important.

Two-year outcomes following a randomised platelet transfusion trial in preterm infants

Carmel Maria Moore, Angela D'Amore, Suzanne Fustolo-Gunnink, et al. *Arch Dis Child Fetal Neonatal Ed*.

<https://pubmed.ncbi.nlm.nih.gov/36810309>

Objective is to assess mortality and neurodevelopmental outcomes at 2 years of corrected age in children who participated in the PlaNeT-2/MATISSE (Platelets for Neonatal Transfusion - 2/Management of Thrombocytopenia in Special Subgroup) study, which reported that a higher platelet transfusion threshold was associated with significantly increased mortality or major bleeding compared to a lower one. Infants randomised to a higher platelet transfusion threshold of  $50 \times 10^9/L$  compared with  $25 \times 10^9/L$  had a higher rate of death or significant neurodevelopmental impairment at a corrected age of 2 years. This further supports evidence of harm caused by high prophylactic platelet transfusion thresholds in preterm infants.

Effect of leuprolide acetate, a GnRH agonist, on neuroinflammation and anxiety-like behavior after mild hypoxic-ischemic encephalopathy in rat model

Karina Alejandra Pedroza-García, Denisse Calderón-Vallejo, Daniel Cervantes-García, et al.

*Neuroimmunomodulation*.

<https://www.ncbi.nlm.nih.gov/pubmed/37607495>

The aim of this study was to evaluate the immunomodulatory effect of leuprolide acetate (LA) in the acute phase of mild HIE and its effects in motor activity and behavior in a subacute phase.

Forty-five Wistar rats on postnatal day 7 were divided into Sham, HIE treated with saline solution (HIE-SS) and HIE-LA. The expression of the inflammatory cytokines interleukin (IL)-1beta, tumor necrosis factor (TNF)-alpha, interferon (IFN)-gamma, and the chemokine CXCL-1

were evaluated 72 h after HIE by RT-qPCR and the motor activity and behavior were evaluated by open field test at postnatal day 33. HIE-SS animals showed increased expression of IL-1beta, TNF-alpha, IFN-gamma and CXCL-1 genes in injured tissue. However, the HIE-LA group exhibited similar expression levels of IL-1beta and TNF-alpha to the Sham group, while IFN-gamma and CXCL-1 mRNA expression were attenuated with LA treatment. LA treatment also prevented anxiety-like behavior in the open field test. Treatment with LA partially reverses HIE-induced neuroinflammation and prevents anxiety-like behavior in neonatal rats.

Overactivated epithelial NF-kappaB disrupts lung development in congenital diaphragmatic hernia

Florentine Dylong, Jan Riedel, Gaurang M Amonkar, et al. *Am J Respir Cell Mol Biol*.  
<https://www.ncbi.nlm.nih.gov/pubmed/37552822>

Recent studies discovered that inflammatory processes, and specifically NF-kappaB associated pathways are enriched in human and experimental CDH. Using sections and hypoplastic lung explant cultures from the nitrofen rat model of CDH and human fetal CDH lungs, the authors demonstrate that NF-kappaB and its downstream transcriptional targets are hyperactive during abnormal lung formation in CDH. Fetal rat lung explants had impaired pseudoglandular airway branching after exposure to nitrofen, together with increased phosphorylation and transcriptional activity of NF-kappaB. Dexamethasone, the broad and clinically applicable anti-inflammatory NF-kappaB antagonist, rescued lung branching and normalized NF-kappaB signaling in hypoplastic lung explants. These results indicate that NF-kappaB is aberrantly activated in human and nitrofen CDH lungs. Anti-inflammatory treatment with dexamethasone and/or specific NF-kappaB inhibition should be investigated further as a therapeutic avenue to target lung hypoplasia in CDH.

Antenatal steroids, prophylactic indomethacin, and the risk of spontaneous intestinal Perforation

Abbot R Laptook, Heather Weydig, Luc P Brion, et al. *J Pediatr*.  
<https://pubmed.ncbi.nlm.nih.gov/37172814/>

This retrospective cohort study was conducted on 6851 infants, gestational age 22 0 -28 6 weeks or birth weight of 401-1000 g to assess if the odds of spontaneous intestinal perforation (SIP) are increased when antenatal steroids (ANS) given close to delivery are combined with indomethacin on day 1 after birth (Indo-D1). Of 6851 infants, 243 had SIP (3.5%). ANS exposure occurred in 6393 infants (93.3%) and IndoD1 was given to 1863 infants (27.2%). The time (median, IQR) from last dose of ANS to delivery was 32.5 hours (6-81) vs 37.1 hours (7-110) for infants with or without SIP, respectively (P = .10). Indo-D1 was given to 51.9 vs 26.3% of infants with SIP vs no SIP, respectively (P < .0001). Adjusted analysis indicated no interaction between time of last ANS dose and Indo-D1 for SIP (P = .7). Indo-D1 but not ANS was associated with increased odds of SIP (aOR: 1.73, 1.21-2.48, P = .003). The results from this study suggest that Indomethacin on day 1 after birth and not timing of ANS is associated with SIP.

Hyperbilirubinemia among infants born preterm: peak levels and association with neurodevelopmental outcomes

Gonzalo Solis-Garcia, Kamini Raghuram, Sajit Augustine, et al. *J Pediatr*.  
<https://pubmed.ncbi.nlm.nih.gov/37172811/>

This multi-center retrospective cohort study describes the distribution of peak bilirubin levels among infants born before 29 weeks of gestation in the first 14 days of life and to study the association between quartiles of peak bilirubin levels at different gestational ages and neurodevelopmental outcomes. A total of 12,554 Neonates born preterm at 22 0/7 to 28 6/7 weeks of gestation born between 2010 and 2018 were included. The median peak bilirubin values

increased as gestational age increased. Significant neurodevelopmental impairment was identified in 1116 of 6638 (16.8%) of children. Multivariable analyses identified an association between peak bilirubin in the highest quartile and neurodevelopmental impairment (aOR 1.27, 95% CI 1.01-1.60) and receipt of hearing aid/cochlear implant (aOR 3.97, 95%CI: 2.01-7.82) compared with the lowest quartile. This study suggests that peak bilirubin values in the highest gestational age-specific quartile were associated with significant neurodevelopmental and hearing impairments. A major limitation of the study is that they did not have access to data regarding phototherapy treatment, and different phototherapy thresholds for different gestational ages may have played a role in the results.

Early-life exposure to analgesia and 18-month neurodevelopmental outcomes in very preterm infants

Thiviya Selvanathan, Pearl Zaki, Mia A McLean, et al. *Pediatr Res*.

<https://pubmed.ncbi.nlm.nih.gov/36859445/>

Preterm infants are exposed to painful procedures during a period of rapid brain development. This multicenter prospective study showed that in very preterm neonates, both early-life exposure to pain and analgesia are associated with adverse neurodevelopment and altered brain maturation. Specifically, for morphine, the interaction between duration of early morphine exposure and number of invasive procedures ( $p = 0.01$ ) was significantly associated with lower Motor scores. However, this association is attenuated for infants with short morphine exposure ( $<7$  days). No significant associations were seen with fentanyl exposure.

Response to aerosolized calfactant in infants with respiratory distress syndrome; a post-hoc analysis of AERO-02 trial

Dinushan C Kaluarachchi, Henry A Zapata, Heather L Becker, et al. *J Perinatol*.

<https://pubmed.ncbi.nlm.nih.gov/37429958/>

AERO-02 trial originally showed aerosolized calfactant (AC) group had reduced intubation and surfactant instillation by nearly one-half compared to usual care (UC) group. This post hoc analysis assessed response to AC among infants born 28 0/7–36 6/7 weeks with RDS from time of randomization to 72 hours. FiO<sub>2</sub>, MAP, and RSS were lower in the UC group. This is likely due to early and higher rate of liquid surfactant administration in the UC group. FiO<sub>2</sub> decrease was seen after the first AC dose.

Rectal acetaminophen improves shunt volume and reduces patent ductus arteriosus ligation in extremely preterm infants

Michael P Castaldo, Elaine Neary, Adrienne R Bischoff, et al. *Am J Perinatol*.

<https://pubmed.ncbi.nlm.nih.gov/34583409/>

In this retrospective matched case-control study the authors sought to evaluate the efficacy of rectal acetaminophen in modulating the risk of PDA ligation. Forty infants (20 cases and 20 controls)  $<29$  weeks' gestation with evidence of hsDA, with similar demographic and echocardiographic features, were compared. Rectal acetaminophen was associated with improvement in echocardiographic indices of PDA shunt volume, a 50% reduction in PDA ligation rates and a reduction in the composite outcome of death or severe BPD. Pharmacologic and further prospective clinical studies are needed.
