Question 253			
A 6-month-old male infant is seen for his routine health supervision visit. He is doing well at home, gaining weight, and meeting his milestones. The mother mentions some concerns about flattening of her son's head posteriorly, and you examine his head from above. While he has no evidence of torticollis, he has right-sided flattening of the occiput as well as flattening above the right orbit, giving a trapezoidal appearance to his head. His mother confirms that they have been placing him in a supine position to sleep at night. They also have been giving him "tummy time" at home during the day and, since his last checkup at 4 months of age, have been alternating his sleeping direction on a weekly basis so that his left and right sides are facing his bedroom door equally.			
Of the following, you are MOST likely to recommend			
<ul> <li>A. continued tummy time and alternating head direction in bed with follow-up in the</li> <li>B. referral to a pediatric neurosurgeon for evaluation for a possible right coronal cra</li> <li>C. referral to a physical therapist to work with the parents on neck stretching exercis</li> <li>D. referral to the craniofacial team to fit a helmet to correct the positional head defo</li> <li>E. a switch to a prone sleeping position now that he is capable of rolling over and h</li> </ul>	niosynostosis ses rmity		

4. You will then be able to see your assessment results. Click the OK button.

5. You will now see an option to Take Again.

6. Select the option you would like to retake the assessment.
